LADON DAVIS

Software Engineer — Backend & Full-Stack

Seattle, WA · US work authorization · cjdavis766@gmail.com · viceatlas.com · github.com/viceatlas · viceatlas.github.io

Building and shipping software since 2020, alone. I build systems that grade their own work: a live consumer product on Next.js and Postgres, Python decision engines with an append-only ledger, and LLM pipelines on the Anthropic SDK that score their own output.

PROJECTS

- **self-grading-demo** — an agent pipeline that grades its own output: LLM-as-judge, sha256-frozen rubric, hash-chained ledger; keyless, under a second. github.com/viceatlas/self-grading-demo
- **role-scout** — job discovery over ATS APIs; the model scores, a human approves every action. github.com/viceatlas/role-scout
- **viceatlas.com** — the live product below; predictions locked before events, graded in public. viceatlas.com

EXPERIENCE

Software Engineer — Independent 2020 – Present · Seattle, WA

Self-employed · sole engineer on everything below and three client websites, from schema to deploy to the incident write-up

ViceAtlas — consumer web product, live at viceatlas.com since July 2026

- Built and operate a production Next.js/TypeScript app on Supabase/Postgres and Vercel: **1,355 prerendered pages** (build of Aug 31, 2026), Discord OAuth and magic-link sign-in, 47 migrations and 84 row-level-security policy statements (repo count, Oct 2026).
- Hardened it for production: moderation that fails closed to a human queue, Postgres rate-limit triggers, /api/health, and two GitHub Actions cron workflows at 100 of 100 recent runs green (Oct 2026).

Quantitative decision engines — Python

- Shipped a risk-gated options decision engine (FastAPI, Pydantic v2, async SQLAlchemy): a layer can only tighten the decision, and a runtime check fails the run on violation; 60 of 66 nightly decisions graded against the next open, Apr–Oct 2026.
- Made the record tamper-evident: **write-once decision freezes** before each event and an append-only cross-system SQLite ledger with nine write-time fences and 29 hard-fail checks; a checker recomputes 96 probes and exits nonzero on drift.
- Built **walk-forward, leak-free calibration** (shrunk-Wilson lower bounds; purged, embargoed splits over **10.1M labeled outcomes**, Jul 2026 run); 619 tests (Oct 2026); one strategy retired against a kill bar frozen before the data arrived.

LLM research pipeline — Anthropic SDK, on a VPS cron since July 2026

- Built a **seven-stage LLM pipeline**, plan through package, in a TypeScript monorepo (Fastify, BullMQ, Prisma): strict JSON output contracts with fail-loud parsing, per-step token metering in Postgres; 411 vitest cases (static count, Oct 2026).
- Evaluation in the production path: an **adversarial LLM-as-judge** scores every claim against its fetched evidence under a versioned rubric: **81 of 84 claims supported** across six production runs, Aug–Oct 2026 (not yet validated against human labels).

SKILLS

Languages	TypeScript, Python, SQL, Node.js
Backend & data	Next.js, React, FastAPI, Pydantic v2, SQLAlchemy (async), REST APIs, OAuth, PostgreSQL (migrations, RLS, triggers), Supabase, SQLite
Infra & ops	Linux VPS, cron, GitHub Actions, Vercel, Docker, health checks, fail-closed design, pytest, vitest, Playwright, Git
AI / LLM	Anthropic SDK, OpenAI API, multi-stage LLM workflows, strict JSON output contracts, LLM-as-judge evaluation
